How to fix "Fatal error: Call to undefined function: curl_init()" on FreeBSD and Debian

Author : admin

After installing the Tweet Old Post wordpress plugin and giving it, I've been returned an error of my PHP code interpreter:

Call to undefined function: curl_init()

As I've consulted with uncle Google's indexed forums ;) discussing the issues, I've found out the whole **issues are caused by a missing php curl module**

My current PHP installation is installed from the port tree on FreeBSD 7.2. Thus in order to include support for *php curl* it was necessery to install the port **/usr/ports/ftp/php5-curl** :

```
freebsd# cd /usr/ports/ftp/php5-curl
freebsd# make install clean
```

(note that I'm using the php5 port and it's surrounding modules).

Fixing the **Call to undefined function: curl_init()** on Linux hosts I suppose should follow the same logic, e.g. one will have to install php5-curl to resolve the issue.
Fixing the missing curl_init() function support on Debian for example will be as easy as using apt to install the php5-curl package, like so:

```
debian:~# apt-get install php5-curl
...
```

Now my tweet-old-post curl requirement is matched and the error is gone, hooray ;)
